Set Up An AWS Account

Owais Yousuf

Introducing Today's Project!

In this project, I'm going to set up an aws account for future aws projects.

Key tools and concepts

The key tools I used include AWS and google authenticator app. Key concepts I learnt include how to setup aws account, how to setup billing and how to enable MFA(multi-factor authentication).

Challenges and wins

This project took me approximately 30 minutes. The most challenging part was downloading authenticator app.

Creating My AWS Account

In this step, I'm going to setup an aws account.

Understanding the root user

I learned that a root user is the main user who is going to using this account fully with all access. Strong password is important as to keep our account protected from being compromised by cyber attacks.

Setting Up Billing and Payment

In this step, I'm going to setup billing plan and payment information.

Why AWS requires a payment method

I learned that AWS requires a payment method because it needs to confirm that it's a normal human not a bot taking advantage of the free period.

Completing Account Activation

In this step, I'm going to confirm my identity and select a support plan.

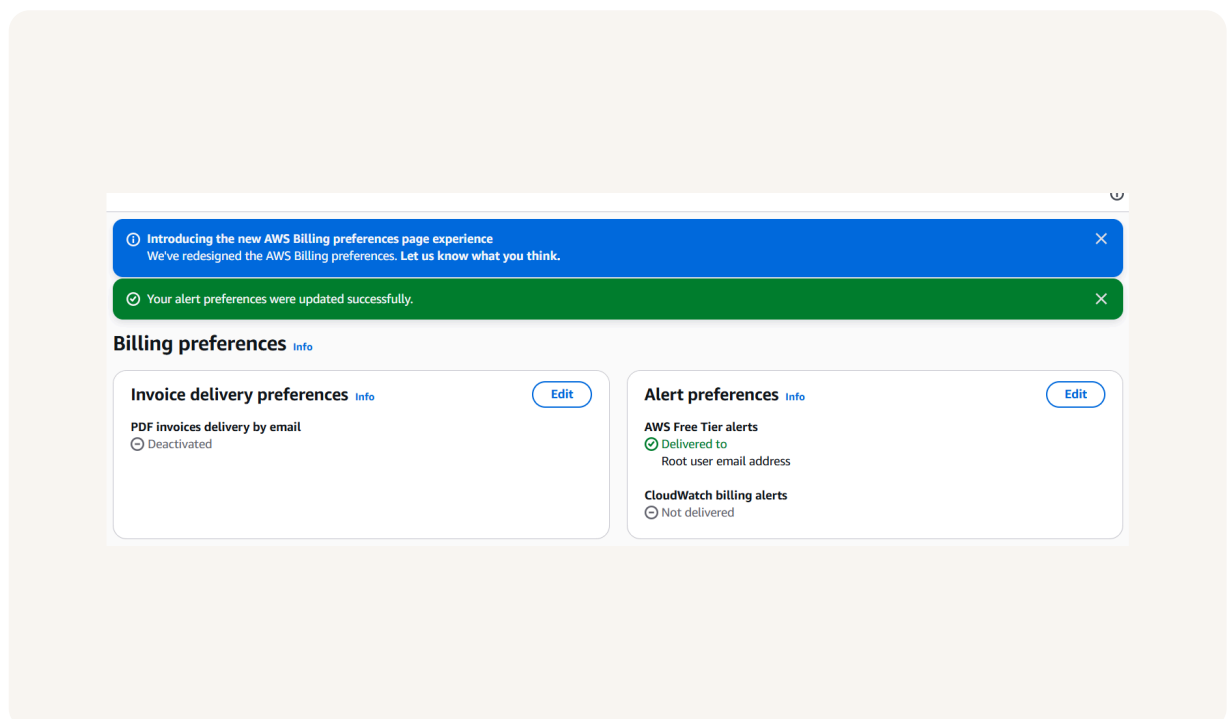

Identity verification and support plan

I verified my identity by entering the otp sent on my phone number. The Basic support plan includes things like access to every aws services documentation

Enabling Free Tier Alerts

In this step, I'm going to setup usage alert so that i can get an email when my credits are going to expire.

Why usage alerts matter

I set up usage alerts because i want to know when my free usage limit is about to be reached.

Securing the Account with MFA

To enable MFA, I used the authenticator app. The authenticator app works by scanning time sensitive QR code which refreshes every 30 seconds so we have to be quick.
